NyAlternate names: NCAM-180
NyAlternate names: NCAM-180
NyContains: neural cell adhesion molecule, short domain splice form (NCAM-140)
C; Species: Mus musculus (Duouse mouse)
C; Date: 31-Mar-1993 #sequence_revision 31-Mar-1993 #text_change 31-Dec-2000
C; Accession: A29673; S00844; S00384; A42290; S00383

FUNCTION: MAY PLAY A ROLE IN THE PROCESSES OF LYMPHOCYTE HOMING TO SECONDARY LYMPHOID ORGANS.
SUBCELLULAR LOCATION: Type I membrane protein (Potential).
TISSUE SPECIFICITY: PROMINENTLY EXPRESSED ON HIGH ENDOTHELIAL VENUTLES BUT IS ALSO PRESENT ON THE ENDOTHELIA OF OTHER VESSELS.
LOCALIZED TO THE INTERCELLULAR BOUNDARIES OF HIGH ENDOTHELIAL

"X-ray structure of junctional adhesion molecule: structural basis for mopphilic adhesion via a novel dimerization motif.";

I MMO. J. 20:4391-4398 (2001).

I FUNCTION: Seems to plays a role in epithelial tight junction formation. Appears early in primordial forms of cell junctions and recruits PARD3. The association of the PARD3 complex may prevent the interaction of PARD3 with JAM1, thereby preventing tight junction assembly. Plays a role in regulating monocyte transmigration involved in integrity of epithelial barrier.

Involved in platelet activation.

Involved in platelet activation.

SC -1- SUBUNIT: Interacts with the first PDZ domain of PARD3. The association between PARD3 and PARD6B probably disrupts this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                     "Combined treatment of TMF-alpha and IFM-gamma causes redistribution of junctional adhesion molecule in human endothelial cells.";

"Combined treatment of 1535-557(1899).

"I Immunol. 163:153-557(1899).

"I FUNCTION: Seems to plays a role in epithelial tight junction formation. Appears early in primordial forms of cell junctions and recruits PARD3. The association of FARD3 with JAMI, thereby preventing prevent the interaction of PARD3 with JAMI, thereby preventing tight junction assembly (By similarity). Plays a role in regulating monocyte transmigration involved in integrity of epithelial barrier. Involved in platelet activation.

"SUBJUNIT: Interacts with the first PDZ domain of PARD3. The association between PARD3 and PARD6B probably disrupts this interaction (By similarity).

"INSUBJUAR LOCATION: Type I membrane protein (Potential).

"INSUBJUARITY: Belongs to the immunoglobulin superfamily.

"INTLARITY: Contains 2 immunoglobulin superfamils.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   75

Proc. Natl. Acad. Sci. U.S.A. 88:4897-4901(1991).
-!- FUNCTION: MAY FUNCTION AS A CELL ADHESION MOLECULE. LACKS PROBABLY
THE CATALYTIC ACTIVITY OF TYROSINE KIRASE.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: EXPRESSED IN BONE MARROW, SPLEEN, BURSA,
THYMUS AND BRAIN. WEAKLY EXPRESSED IN PIBROBLASTS. ALSO EXPRESSED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -i- SIMILARITY: Contains 7 immunoglobulin-like C2-type domains.
-i- SIMILARITY: Belongs to the Tyr family of protein kinases. Insulin receptor subfamily.

--- TISSUE SPECIFICITY: Expressed in subsets of both olfactory and vomeronasal neurons in a zone-specific manner.
--- SIMILARITY: Contains 5 immunoglobulin-like C2-type domains.
--- SIMILARITY: Contains 2 fibronectin type III domains.

TISSUE SPECIFICITY: EXPRESSED BY ALL NEUROCENIC CELLS EARLY, BUT
ONLY THOSE CELLS THAT BECOME NEUROBLASTS CONTINUE TO EXPRESS IT.
EXPRESSED BY NEUROBLASTS, GANGLION WOTHER CELLS AND NEURONS EARLY
IN THEIR LIVES, BUT EXPRESSION BECOMES RESTRICTED TO A SUBSET OF
NEURONS AS DEVELOPMENT PROCRESSES. EXPRESSED BY SENSORY NEURONS AS
THEY DELAMINATE FROM THE BODY WALL ECTODERM. IT IS ALSO PRESENT ON
GROWING AXONS OF THE CNS AND PNS AND BECOMES RESTRICTED TO A
SUBSET OF AXONS LAFTER IN DEVELOPMENT.
BUYGLOPMENTAL STAGE: EXPRESSED ON DIFFERENTIATING NEURONAL CELLS
FROM THE ONSET OF NEUROGENESIS IN BOTH THE CENTRAL AND PERIPHERAL
                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: MAY PLAY A ROLE IN EARLY NEURONAL DIPFERENTIATION AND
